The present sequence is the antigenic epitope P545, derived from choptry associated protein-1 (RAP-1) of the asexual blood stage of properly associated protein-1 (RAP-1) of the asexual blood stage of promoting the construction of recombinant protein copyrization of recombinant protein copyrization of protein copyrization comprises, melittin signal peptide, vaccine. The recombinant protein comprises, melittin signal peptide, religibly to a protein (GSP), sporczoite surface protein-2 from tetanus toxoid and 21 antigenic epitopes (SSP-2), liver stage antigen-1 (GSP-1), merozoite surface protein-1 (SSP-1), MSP-2, apical membrane antigen-1 (ARA-1), erythrocyte binding antigen-175 (BBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg22. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMANYAC-1 vaccine has cantainal infections. Anti-LDC/NIIMALVAC-1 antibodies can be used for malarial infections. Anti-LDC/NIIMALVAC-1 antibodies can be used for malarial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A non-dendritic peptide carrier (A) has been developed which is coupled through a linker to a solid phase, forming a complex of (A)-solid phase. Where (A) comprises 10-50 amino acids capable of forming a secondary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T-cell stimulatory peptide; immunogen; non-dendritic; carrier; tumour; scaffold; inhibition; metastasis; wound healing; solid phase.
 Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Non-dendritic peptide carrier linked to a solid phase - useful as diagnostic agent and as a scaffold for production of chemical

structure in a benign buffer after liberation from the solid phase, and further the (A)-solid phase complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence cand/or an immune mediator coupled on (A). The present sequence cand/or solid phase complex can be used as a scaffold for the production of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold-peptide for the incorporation into an Immunostimulating Complex (Iscom) resulting or the incorporation into an Immunostimulating Complex (Iscom) resulting or substances in an aqueous solution by conjugation. (A) derivatised with substances in an aqueous solution by conjugation. (A) derivatised with cone or more peptides having fibronectin., laminin. or vitronectin.like one or more peptides having fibronectin., laminin. or vitronectin.like one or more peptides having fibronectin., laminin. or vitronectin.like one bused to knound healing. Also a derivatised (A) can be used and for promortion of specifically-binding aptamers or as a diagnostic for the selection of specifically-binding aptamers or as a diagnostic fibratived from or indicative of pregnancy or of a disease, such as an entitement of infantive from or indicative of pregnancy or of a disease, such as an

Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included 5' ESTs are derived from mRNAs with intact 5'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ends and can therefore be used to obtain full length CDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      regulatory sequences and to design expression and secretion vectors.
    Gene product may be isolated from a transformed E.coli (*11088) expression system using plasmid pMC9, and may then be used for immunisation against malaria. The product may also be used diagnostically to detect Abs directed against the parasite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                       The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His) 6 tag, T-cell epitope from tetanus toxoid and 21 antigent epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LGA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of Plasmoddum falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                           Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle -

The present sequence is a polypeptide encoded by one of a large number of 5 ESTS derived from mRNAs encoding secreted proteins. The 5 ESTS of 5 ESTS derived from total human RNAs or poly4+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3 curtanglated region (UTR) of the mRNA because they are often obtained to include of primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in 5 those cases where longer cDNA sequences have been obtained, the full 5' those cases where longer cDNA sequences have been obtained, the full 5' or make and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream croundatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding 4277 human colon cancer-associated polypeptides,

AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, sapingitis, and postible particular paratrachoma. An artholimitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzeamer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral scleroslis; SNy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAI57798-AAI61369) and

                                                        AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens. The colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, capparesion. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a partient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell of express the proteins. N and P can be used in the prevention, diagnosis and AAB7789 represent sequences used in the exemplification of the

    the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotide or in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous coff the invention may be used to treat diseases, peripheral nervous coff is such as peripheral nervous injuries, peripheral nervous coff alzeanes, such as disease, must not as alzeanes, any otrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activity, chamotactic/chemokinetic activity, haemostatic conditional and thrombolytic activity, cancer diagnosis and therapy, drug screening, and thrombolytic activity, arthritis and inflammation, leukaemias and construction construction. Sistem of the printed screening.
                                                                                                                                                                                                         ,

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and
the encoded polypeptides (AAA38642-AAM42213) with nootropic,
the encoded polypeptides (AAA38642-AAM42213) with nootropic,
cc imministration may be used to treat diseases of the peripheral nervous
cc of the invention may be used to treat diseases of the peripheral nervous
cc system, such as peripheral nervous injuries, peripheral neuropathy and
cs system, such as peripheral nervous injuries, peripheral neuropathy and
cs system, such as peripheral nervous system diseases, such as
localised neuropathies and central nervous system diseases, such as
cc lateral sclerosis, and Shy-brager Syndrome. Other uses include the
lateral sclerosis, and Shy-brager Syndrome. Other uses include the
cutilisation of the activity, chemotactic/chemokinetic activity, haemostatic
cc utilisation of the activity, cancer diagnosis and therapy, drug screening,
and thrombolytic activity, cancer diagnosis and therapy, drug screening,
cc assays for receptor activity, arthritis and inflammation, leukaemias and
cn.N.s disorders.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                          ; Search time 133.18 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 25,

Patent No. 6303766
GENERAL INFORMATION:
GARBAU, ELIZABETH A.
APPLICANT: HEGEMAN, CARLA E.
TITLE OF INVENTION: SOYBEAN PHYTASE AND NUCLEIC ACID ENCODING THE SAME
                                                                                                                                  APPLICANT: In M. Whitehead
APPLICANT: Alan Slusarenko
APPLICANT: Duncan Gaskins
APPLICANT: Duncan Gaskins
APPLICANT: Alan Brash
APPLICANT: Nathalie Tijet
TITLE OF INVENTION: GUAVA (PSIDIUM GUAJAVA) 13-HYDROPEROXIDE
TITLE OF INVENTION: GUAVA (PSIDIUM GUAJAVA) 13-HYDROPEROXIDE
TITLE OF INVENTION: LYASE AND USES THEREOF
FILE REFERENCE: 06027.0001

PROTEINS PRIBITING THE GDP/GTP EXCHANGE REACTION OF MOST RAB

--- FUNCTION: REGILATES THE GDP/GTP EXCHANGE REACTION OF WOST RAB

--- SUBSEQUENT BINDING OF GTP TO THEM.

--- SIGNERGUENT SELOITY: UBIQUITOUS.

--- SIRILARITY: BELONGS TO THE TCD/MRS6 FAMILY OF GDP DISSOCIATION

Required for trans-golgi network-to-plasma membrane

"Rabli is required for trans-golgi network-to-plasma membrane

ransport and a preferential target for GDP dissociation inhibitor.";

Mol. Biol. Cell 9:3241-3257(1998).

--- FUNCTION: REGULAPTES THE GDP/GTP EXCHANGE REACTION OF MOST RAB

PROTEINS BY INHIBITING THE DISSOCIATION OF GDP FROM THEM, AND THE

SUBSEQUENT BINDING OF GTP TO THEM (BY SIMILARITY).

--- SIMILARITY: BELONGS TO THE TCD/MRS6 FAMILY OF GDP DISSOCIATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens (Human).

                                                                   Lal AA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                        The present sequence is the antigenic epitope P604, derived from choptry associated protein-1 (RAP-1) of the asexual blood stage of proper protein-1 (RAP-1) of the asexual blood stage of proper and a sequence plasmodium falciparum. It is used in the construction of recombinant protein CDC/VINIMALVAC-1, which is a multivalent, multistage malarial protein CDC/VINIMALVAC-1, which is a multivalent, multistage malarial cancine. The recombinant protein comprises, melittin signal peptide, vaccine. The recombinant protein comprises, melittin signal peptide, confirmation circumsproreoite protein (CSAP-1), merozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (SSP-1), MSP-2, apical membrane antigen-1 (LSA-1), merozoite surface protein-1 (SSP-1) and gamete cantigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for malarial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; r-cell epitope; tetanus toxoid; antigenic epitope; treatment; circumsporozoite protein; CSP; sporozoite surface protein:2; SSP-2; liver stage antigen:1; LSA-1; merozoite surface protein:1; MSP-1; MSP-2; mapical membrane antigen:1; AMA-1; erythrocyte binding antigen:175; EBA-175; rhoptry associated protein:1; RAP-1; gamete specific antigen; prevention; anti-CDC/NIIMALVAC-1 antibody;

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vacche. The recombinant which is a multivalent, multistage malarial vacche. The recombinant protein comprises, melittin signal peptide, (His)6 tag, Treel epitope from teranus toxoid and 21 antigenic epitopes from circumsporozoite from teranus toxoid and 21 antigeni-2 (SSP-2), liver stage protein (GSP), sporozoite surface protein-1 (MSP-1), mesp.2, apical antigen-1 (MSP-1), mesp.2, apical cantigen-1 (MAP-1), membrane antigen-175 (EBA-175), membrane antigen-175 (EBA-175), membrane antigen-175 (EBA-175), crhoptry associated protein-1 (MAP-1) and gamete specific antigen, Pfg27. Those epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting contractions and protein the contraction of malarial contractions. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                    Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle

The Ri gene is associated with paraneoplastic opsocionus (PO). The DNA sequence encoding this polypeptide was isolated via an Ri clone, Ri8, which was isolated from a cerebellar cDNA expression vector library derived from antiserum from a single patient with PO. Phagemid was excised from lambda-Ri8 using the helper phage R408, the resulting

                                                                                                                                                                                                                                                                                         -
                                                                          Gene product may be isolated from a transformed E.coli (Y1088) expression system using plasmid pMC9, and may then be used for immunisation against malaria. The product may also be used diagnostically to detect Abs directed against the parasite.
                                                                                                                                                                                                                                        Score 68.5; DB 11; Length 782;

The allele, designated san5 or abi4-2, has a deletion of one of the three adenines at positions 277-279 relative to the wild-type allele (designated ABI4), which causes a change in the reading frame leading to a shorter, variant C-terminus from amino acid residue 44 onwards. The abi4-2 protein (AABB9825) does not contain the APETALA2 (AR2) domain located between residues 55-110 in the wild-type ABI4 protein (AAB98923) which mediates
plasmid being designated pRi8 (see also AAQ30801). pRi8 was cloned and propagated in E. coli. pRi8 encoded a protein of mol. wt. 40 kD which is recognised by anti-Ri antiserum. This Ri8 fusion protein was used as an antigen to affinity purify antibody from the anti-Ri antiserum. The DNA sequence of pRi8 was determined by the dideoxy method and an open reading frame encoding approx. 34 maino acids was identified. Regions of this sequence could be used to make PCR probes such that additional clones representing the full length Ri gene could be
